Dear Founding Team,

I am writing to apply for your Founding Full-Stack AI Engineer role. A VC-backed team putting AI into the messy, real-world workflows of construction, where the value is operational rather than a demo, is exactly the kind of problem and the kind of early-stage ownership I am looking for, and the reason I want to join a startup now rather than a larger, more settled team.

Most recently, I designed, built, and deployed thinkTree.AI, a study platform that helps people with ADHD stay focused without losing their context as they work. I took it end to end, from the React and TypeScript frontend through the backend services and data model to the LLM-powered features that make it genuinely useful, and shipped it into production rather than leaving it a prototype. It now has around 40 monthly active users, and building something that people with ADHD actually rely on to study taught me that the AI has to be dependable in the real world, not just impressive in a happy-path demo.

On the stack side, your environment maps closely to how I already work: TypeScript and React, Next.js, Supabase and PostgreSQL, and Vercel, with LLM integrations and the Vercel AI SDK. On the AI side, I have built the things this role leans on, including agentic workflows, tool calling, and multi-step orchestration, along with RAG and embeddings, and put them into a live product with real users rather than a notebook.

What I care about most, and where I think I would add the most, is the part of your post about making AI dependable, observable, and useful in the real world rather than simply building prototypes. That has become my focus: a feature that looks great in a demo and quietly fails in front of users is worse than no feature. I have put real effort into evaluation and reliability, measuring whether an AI workflow is actually correct, catching regressions before users hit them, and being honest about uncertainty instead of papering over it. For a construction project-management platform, where a wrong automated step carries real cost, I believe that discipline is the difference between a tool teams trust and one they switch off.

I am comfortable in a small team where priorities move quickly and engineers carry genuine responsibility, and I would be glad to work side by side with the founders, challenging assumptions, talking to customers, and turning their problems into shipped software. The Munich hybrid setup works well for me.

I would love to talk about where you are taking the product and where I could own the most from day one.

Best regards,
Abhinav
